alkylene with 1 to 3 carbon atoms, or
a salt thereof.

SPECIFICATION

Antihypertensive 5-Substituted 2-Pyrrolidinecarboxylic Acids and Salts Thereof

This invention relates to derivatives of 5-substituted 2-pyrrolidinecarboxylic acid and salts thereof which are useful as antihypertensive agents. These compounds are represented by the formula

wherein R¹ is phenyl, hydroxyphenyl, mercapto-lower alkyl, acylmercapto-lower alkyl, higher alkyl, higher alkenyl, cycloalkyl, aralkyl, aralkenyl, furyl, thienyl, imidazolyl, pyridyl, naphthyl, benzofuryl, benzothienyl, indolyl, substituted higher alkyl, substituted higher alkenyl, substituted cycloalkyl, substituted aralkyl, substituted aralkenyl, substituted phenyl, substituted furyl, substituted thienyl, substituted imidazolyl, substituted pyridyl, substituted naphthyl, substituted benzofuryl, substituted benzothienyl, or substituted indolyl wherein the substituent(s) is or are lower alkyl, hydroxy-lower alkyl, hydroxy, mercapto, lower alkoxy, lower alkylenedioxy, acyloxy, acylmercapto, halogen, nitro, amino, lower alkylamino, acylamino or carboxy, except hydroxyphenyl; R² is hydrogen or benzoyl; Q is a straight or branched alkylene with 1 to 3 carbon atoms (e.g. —CH₂—, —CH₂CH₂—, —CH(CH₃)CH₂—);

15 In This Specification:—

lower alkyl, alkenyl or alkylene means a saturated or unsaturated, straight or branched chain with 1 to 6 carbon atoms; higher alkyl or alkenyl means a saturated or unsaturated, straight or branched chain with 7 to 20 carbon atoms; acyl includes acetyl, pivaloyl, substituted or unsubstituted benzoyl and benzyloxycarbonyl; aralkyl includes benzyl.

20 The compounds of formula I of this invention are mercaptoacylamino acids and S-substituted mercaptoacylamino acids. Mercaptoacylamino acids have an inhibitory activity against angiotensin converting enzyme and therefore they are useful as antihypertensive agents. S-substituted mercaptoacylamino acids release mercaptoacylamino acids by enzymatic and/or chemical cleavage when administered to men or animals.

25 The compounds of formula I can be produced by the following methods.
An acid of the formula II

is reacted with a functional derivative of alkanolic acid of the formula III

30 preferably by one of the known procedures wherein the compound III is activated by forming a mixed anhydride, a symmetrical anhydride, acid chloride or an active ester prior to reaction with the acid II to produce the compounds of the formula I. The resulting compound can then be converted to the compound of formula I, wherein R² is hydrogen, by hydrolysis or reduction (such as by acid treatment with hydrochloric acid or p-toluenesulfonic acid for example; by alkali treatment, with sodium
35 hydroxide or ammonia, for example; by catalytic reduction, with palladium-carbon, for example; or by alkaline metal treatment in liquid ammonia).

In another way, the compounds of formula I are produced by reacting an acid of formula II with a functional derivative of a haloalkanoic acid of the formula IV

40 and by reacting the resulting haloacid of the formula V

with thiobenzoic acid. The resulting compound can then be converted to the compound of formula I, wherein R² is hydrogen, by hydrolysis or reduction in the same manner as above.

In the formulae (III, IV and V)

45 R³ is benzoyl,
X is halogen (e.g. bromine or chlorine).

The compounds of formula I synthesized by the above methods can be in the form of conventional salts generally used in medicine, e.g. the sodium, potassium, calcium, aluminium, ammonium, diethylamine or triethanolamine salt.

The compounds of formula I have stereoisomers which are within the scope of this invention because they have asymmetric carbon atoms.

Examples are shown below, although this invention is not limited to these examples.

Example 1

5 1-[(2S)-S-Benzoyl-3-mercapto-2-methylpropanoyl]-5-phenyl-2-pyrrolidinecarboxylic Acid 5

22.8 g of 5-phenyl-2-pyrrolidinecarboxylic acid hydrochloride and 41.7 ml of triethylamine are dissolved in 700 ml of anhydrous acetone. To this solution, 24.3 g of (2S)-S-benzoyl-3-mercapto-2-methylpropanoyl chloride is added dropwise with stirring under ice-cooling. After the addition, the mixture is stirred under ice-cooling for 1 hour and at room temperature for another 1 hour. To the

10 mixture, 5.7 ml of acetic acid is added, and the precipitate is removed by filtration. The filtrate is concentrated in vacuo and the produced oil is dissolved in 500 ml of ethyl acetate. The organic layer is washed with water and saturated sodium chloride solution, dried over magnesium sulfate, and concentrated in vacuo to give 53.8 g of oil. The oil is purified by silica gel column chromatography to give the titled compound, yield 30.2 g (76%), $[\alpha]_D^{25} -45.6^\circ$ (c=1.0, methanol).

15 IR (CHCl₃, cm⁻¹) 1725, 1650, 1580, 910. 15

Example 2

1-[(2S)-3-Mercapto-2-methylpropanoyl]-5-phenyl-2-pyrrolidinecarboxylic Acid

20 g of 1-[(2S)-S-benzoyl-3-mercapto-2-methylpropanoyl]-5-phenyl-2-pyrrolidinecarboxylic acid is dissolved in 50 ml of methanol. To this solution 100 ml of conc. ammonia is added, and the mixture is stirred at room temperature for 1.5 hours. Excess ammonia and methanol are removed in vacuo, and the residue is washed with ethyl acetate. The aqueous layer is acidified with conc. hydrochloric acid, and extracted with ethyl acetate. The organic layer is washed with saturated sodium chloride solution, dried over magnesium sulfate, and concentrated in vacuo to give the titled compound, yield 8.5 g (58%), mp. 138.0—142.5°C (ethyl acetate), $[\alpha]_D^{25} -29.4^\circ$ (c=1.0, methanol).

25 IR (nujol, cm⁻¹, to be applied hereinafter unless specified) 2650, 1740, 1600, 750, 705. 25

Example 3

α - and β -1-(S-Benzoyl-3-mercaptopropanoyl)-5-(2-hydroxyphenyl)-2-pyrrolidinecarboxylic Acid

12.2 g of 5-(2-hydroxyphenyl)-2-pyrrolidinecarboxylic acid hydrochloride and 9.6 g of sodium carbonate are dissolved in 200 ml of water. To this solution, 11.4 g of S-benzoyl-3-mercaptopropanoyl chloride is added dropwise with stirring under ice-cooling. After the addition, the mixture is stirred under ice-cooling for 1 hour and at room temperature for another 1 hour. This reaction solution is washed with ethyl acetate, acidified with conc. hydrochloric acid, and extracted with ethyl acetate. The organic layer is washed with saturated sodium chloride solution, dried over magnesium sulfate, and concentrated in vacuo to give crystals (α -acid). The crystals are collected on a filter, yield 9.4 g (47%).

35 The filtrate is concentrated in vacuo, and purified by silica gel column chromatography to give β -acid, yield 2.4 g (12%). 35

- The potent antihypertensive effect of the compound (I) and related salts of this invention is clear in the comparison of the pharmacological activity between the known compound and the compounds of this invention as explained below. The inhibitor of angiotensin-converting enzyme which converts
- 40 biologically inactive decapeptide, angiotensin I, to active octapeptide, angiotensin II, is found to be useful as antihypertensive medicine. In view of the above, we investigated the pharmacological activities of the compounds of the present invention from the aspect of inhibitory activity against the enzyme. 40

Pharmacological Test 1

- 45 As the method of measurement of angiotensin-converting enzyme activity, bioassay for the contractile response of isolated smooth muscle or the pressor response of normal animals and biochemical assay for the enzyme isolated from lung or other organs of animals are known. The former is found more advantageous than the latter for the examination of the conversion of angiotensin I to angiotensin II in vivo. 45
- 50 In the present study, therefore, we adopted the bioassay for contractile response of isolated guinea-pig ileum to angiotensin I. 50
- Measurement of inhibitory activity of angiotensin-converting enzyme.
- Isolated guinea-pig ileum was suspended in the organ bath containing 20 ml of Tyrode's solution of 30°C gassed with 95% O₂ + 5% CO₂. The contraction induced by the addition of angiotensin I (0.1
- 55 μ g/ml) at intervals of 10 minutes was recorded on a recticorder (Nihon Koden) for 90 seconds using FD pick up (ST-1T-H, Nihon Koden). 55
- The test compounds were added to the bath 5 minutes before the addition of angiotensin I.
- The inhibitory activity of angiotensin-converting enzyme was calculated by the following formula.

$$\frac{A-B}{A} \times 100$$

A: contractile intensity of angiotensin I before addition of the compound

B: contractile intensity of angiotensin I after addition of the compound

- 5 guinea-pig ileum, is thought to be identical with angiotensin-converting enzyme, augmentation of the contractile response to bradykinin by test compounds was examined by using bradykinin (0.005 μ g/ml) in place of angiotensin I according to the above mentioned method. 5

The results are shown in a table. All of the test compounds inhibited the contractile response to angiotensin I, while they enhanced the response to bradykinin.

10 Pharmacological Test 2 10

The activity of angiotensin-converting enzyme was measured by spectrophotometry according to the method of Biochem. Pharmacol., 20, 1637 (1971). That is, the absorbance of hippuric acid was measured, which is liberated by incubating hippuryl-L-histidyl-L-leucine (HHL) as substrate in the presence of angiotensin-converting enzyme extracted from rabbit lung.

15 Measurement of Inhibitory Activity of Angiotensin-converting Enzyme 15

The reaction mixture is as follows:

100 mM phosphate buffer (pH 8.3)

300 mM sodium chloride

5 mM HHL

- 20 10^{-3} — 10^{-9} M enzyme inhibitor 20

5 mU enzyme

0.25 ml of the above mixture was incubated at 37°C for 30 minutes and the reaction was stopped by adding 0.25 ml of 1 N hydrochloric acid. To this solution, 1.5 ml of ethyl acetate was added in order to extract hippuric acid. 1.0 ml of ethyl acetate layer was collected and evaporated to dryness,

- 25 and the residue obtained was dissolved in 1.0 ml of water. The absorbance of this solution was measured at 228 nm. 25

The inhibitor activity of angiotensin-converting enzyme was calculated by the following formula:

$$\text{Percent inhibition} = \frac{A-B}{A} \times 100$$

- 30 A: absorbance of reaction solution before addition of the compound 30
B: absorbance of reaction solution after addition of the compound

Concentration of Compound Producing 50% Inhibition of Angiotensin-converting Enzyme (IC_{50})

The solution containing compounds at the concentration of 1×10^{-3} M to 1×10^{-9} M was incubated and percent inhibition at each concentration was calculated according to the above formula, and then IC_{50} , concentration of compound producing 50% inhibition of the enzyme activity, was determined. 35

- 35 The results are shown in a table.

The compounds examined in these tests are shown below. The compounds of this invention

Compound A: α -5-(2-hydroxyphenyl)-1-(3-mercaptopropanoyl)-2-pyrrolidinecarboxylic acid

Compound B: α -5-(4-hydroxyphenyl)-1-(3-mercaptopropanoyl)-2-pyrrolidinecarboxylic acid

- 40 Compound C: α -5-(2-hydroxyphenyl)-1-[(2S)-3-mercapto-2-methylpropanoyl]-2-pyrrolidinecarboxylic acid 40

Compound D: β -5-(2-hydroxyphenyl)-1-[(2S)-3-mercapto-2-methylpropanoyl]-2-pyrrolidinecarboxylic acid

- 45 Compound E: α -5-(2-hydroxyphenyl)-1-(3-mercaptopropanoyl)-2-pyrrolidinecarboxylic acid 45
Known compound

Compound Z: (4R)-3-[(2S)-3-mercapto-2-methylpropanoyl]-4-thiazolidinecarboxylic acid

Table
Inhibitor Activity Against Angiotensin-converting Enzyme

		<i>Angiotensin I</i>	<i>Bradykinin</i>	<i>Angiotensin-converting enzyme</i>	
	<i>Compound</i>	<i>IC₅₀* (M)</i>	<i>AC₅₀** (M)</i>	<i>IC₅₀*** (M)</i>	
5	A	1.7×10^{-7}	1.8×10^{-9}	5.6×10^{-7}	5
	B	4.8×10^{-7}	9.8×10^{-9}	4.4×10^{-7}	
	C	1.6×10^{-7}	2.0×10^{-9}	1.1×10^{-6}	
10	D	1.5×10^{-7}	2.6×10^{-9}	1.2×10^{-6}	10
	E	7.6×10^{-8}	9.5×10^{-10}	6.5×10^{-8}	
	Z	1.7×10^{-7}	2.6×10^{-9}	2.6×10^{-7}	

*Concentration of compound producing 50% inhibition of the contractive action of angiotensin I on the guinea-pig ileum.

15 **Concentration of compound producing 50% augmentation of the contractive action of bradykinin on the guinea-pig ileum. 15

***Concentration of compound producing 50% inhibition against angiotensin-converting enzyme.

Toxicity Test

Acute toxicity of compound A is low, that is the LD₅₀ value is 1000—1250 mg/kg.

20. (Experimental animals) 20

The male ddy-std strain mice (4 weeks of age, weighing 19—21 g) were placed in a breeding room of constant temperature and humidity (23±1°C, 55±5%) and fed freely pellet diet (CE-2, Clea Japan Inc.) and water ad. libitum for a week. The mice showing the normal growth were selected for the experiment.

25 (Method of Administration) 25

Test compounds are suspended in 0.5% tragacanth solution, and administered intraperitoneally in a dose of 0.5 ml of 20 g body weight.

It is found from the above pharmacological tests that the compounds I of this invention are useful as antihypertensive agents. The compounds can be given with the combination of diuretics as other antihypertensive agents can generally at present. The dosage forms are tablet, capsule, granule, powder, suppository, injection etc. In the treatment of hypertension, these preparations can contain not only general excipients but also other antihypertensive agents such as reserpine, α-methyldopa, guanethidine, clonidine, hydralazine, etc. The dose is adjusted depending on symptoms, dosage form, etc. But, usual daily dosage is 1 to 5000 mg, preferably 10 to 1000 mg, in one or a few divided doses.

35 The following are examples of formulation. 35

(1) Oral Drug

	a. tablet		
	compound A	30 mg	
	lactose	150 mg	
40	crystalline cellulose	50 mg	40
	calcium carboxymethylcellulose	7 mg	
	magnesium stearate	3 mg	
	Total	240 mg	
	compound A	150 mg	
45	lactose	60 mg	45
	crystalline cellulose	30 mg	
	calcium carboxymethylcellulose	7 mg	
	magnesium stearate	3 mg	
	Total	250 mg	
50	compound E	50 mg	50

Claims

1. A compound of the formula I

(I)

wherein

55 R¹ is phenyl, hydroxyphenyl, mercapto-lower alkyl, acylmercapto-lower alkyl, higher alkyl, higher alkenyl, cycloalkyl, aralkyl, aralkenyl, furyl, thienyl, imidazolyl, pyridyl, naphthyl, benzofuryl, 55

- benzothienyl indolyl, substituted higher alkyl, substituted higher alkenyl, substituted cycloalkyl, substituted aralkyl, substituted aralkenyl, substituted phenyl, substituted furyl, substituted thienyl, substituted imidazolyl, substituted pyridyl, substituted naphthyl, substituted benzofuryl, substituted benzothienyl, or substituted indolyl wherein the substituent(s) is or are lower alkyl, hydroxy-lower alkyl, hydroxy, mercapto, lower alkoxy, lower alkylenedioxy, acyloxy, acylmercapto, halogen, nitro, amino, lower alkylamino, acylamino or carboxy, except hydroxyphenyl;
- 5 R^2 is hydrogen or benzoyl, and
 Q is a straight or branched alkylene with 1 to 3 carbon atoms;
 or a salt thereof.
- 10 2. A compound as claimed in claim 1, wherein R^1 is phenyl, 2-hydroxyphenyl or 4-hydroxyphenyl. 10
 3. A compound as claimed in claim 1 or 2, wherein Q is $-\text{CH}_2-$, $-\text{CH}_2\text{CH}_2-$ or $-\text{CH}(\text{CH}_3)\text{CH}_2-$.
 4. A composition comprising a compound as claimed in claim 1 in an amount sufficient to reduce blood pressure and at least one pharmaceutically acceptable excipient(s).
- 15 5. Process for manufacturing a compound as claimed in claim 1, which comprises reacting an acid 15 of the formula II

(II)

with a functional derivative of alkanolic acid of the formula III

- 20 and optionally, subjecting the resulting compound to hydrolysis, reduction or ammonolysis, wherein R^1 , 20
 R^2 and Q are as defined in claim 1, and R^3 is benzoyl.
6. Process for manufacturing a compound as claimed in claim 1, which comprises reacting an acid of the formula II'

(II')

- 25 with a functional derivative of haloalkanoic acid of the formula IV 25

to produce a compound of the formula V

(V)

- and reacting the compound of the formula (V) with thiobenzoic acid, and optionally subjecting the 30
 resultant compound to hydrolysis or reduction, wherein R^1 , R^2 and Q are as defined in claim 1, R^3 is benzoyl and X is halogen.
7. A compound as claimed in claim 1; substantially as hereinbefore described in any one of Examples 1 to 10.
8. A process for manufacturing a compound as claimed in claim 1, substantially as hereinbefore 35
 described in any one of Examples 1 to 10.
